

Real-Time Control Intelligence: Eliminating Silent Drift Before It Becomes Risk

A living, always-on compliance ecosystem – every control is visible, every drift detected instantly

Even with monitoring, controls can degrade silently between audits – MFA toggled off, buckets made public, logging disabled. Enterprises keep raw technical signals scattered, limiting cross-system correlation, historical trend analysis, and executive visibility.

What's holding you back

- Checkbox controls without business context
- Unstable data foundations
- One-way alerts without closed-loop remediation
- Point-in-time snapshots masquerading as continuous
- Over-customizing controls; under-maintaining mappings

What success looks like

- › Controls continuously monitored in real time
- › Drift detected and remediated rapidly
- › Audit exceptions materially decline
- › Risk centralized and contextualized
- › Compliance operations scale without manual overhead
- › Security reviews and sales cycles accelerate

How evolV helps

Centralizes signals in

Snowflake enabling cross-system correlation and time-series drift detection

Attaches business context to each control (asset criticality, data sensitivity, revenue impact)

Designs bi-directional

workflow integration tracking SLA timers, re-open logic, and closure evidence

Why evolV?

- **Continuous** compliance frameworks that scale trust
- **Deep** Snowflake integration expertise
- **Governance** ensuring alert accuracy and context
- **Experience** reducing false positives and MTTR
