

Detect Supply Risk Before Production Slows

Unify supplier, logistics, & demand data to spot bottlenecks & protect delivery commits

Supply chain disruptions cascade into production delays and missed customer commitments, but risk signals exist across supplier performance, logistics tracking, and demand forecasting systems without unified visibility. Without early detection, teams react to shortages instead of preventing them, eroding customer trust and increasing expedite costs.

What's holding you back

- Supplier performance, logistics, and demand data siloed across systems
- React to shortages instead of preventing them with early signals
- Production delays cascade into missed customer delivery commitments
- Expedite costs increase without proactive mitigation
- No unified view of supply chain health and bottleneck risk

What success looks like

- › Early detection of supplier and logistics risks before production impact
- › Reduced expedite costs and fewer missed delivery commitments
- › Proactive mitigation strategies based on unified risk scoring
- › Unified view of supplier performance, logistics tracking, and demand signals

How evol helps

Integrates supplier, logistics, and demand data into a unified supply chain health dataset with real-time risk scoring

Surfaces early warning signals enabling procurement and operations teams to act before production slows

Connects risk detection to mitigation workflows reducing expedite costs and protecting customer commitments

Why evol?

- **Track record** implementing win/loss programs for B2B SaaS and enterprise software companies
- **GTM strategy expertise** translating deal feedback into actionable product and sales improvements
- **Proven interview frameworks** capturing unbiased, actionable competitive intelligence
- **Strong partnership** with sales, product, and marketing to operationalize insights
